UV-TIAMO-S

- Broadband UVA+UVB+UVC amplified SiC UV detector
- Integrated Transimpedance Amplifier
- Sensitivity Range: 227-360 nm
- Approx. max irradiance 18mW/cm²
- TO5 housing with diffuser
- Applications: UV irradiation measurements

Description

The UV-TIAMO devices are using modern hybride technology to cancel unwanted signal disturbances caused by moisture or electromagnetic radiation. The stable 0…5V output voltage can be directly connected to a SPC controller or a voltage multimeter. No external amplifier is needed.

The photodetectors work with a SiC sensing chip. SiC provides the unique property of extreme radiation hardness, near-perfect visible blindness, low dark current, high speed and low noise. These features make SiC the best available material for visible blind semiconductor UV detectors.

UV photodiodes without amplifier and different spectral sensitivities are available.
Outline Dimensions

TO5 with concentrator lens cap

All dimensions in mm

Connection diagram

The detector is to be supplied with a voltage of $V_{\text{supply}} = 2.5...5\text{VDC}$ between pin $V_S$ and pin $GND$.

The voltage output signal is measured between pin $OUT$ and pin $GND$.

Please note that the theoretic maximum signal output is always a little less (approx. 5%) than the supply voltage.

CAUTION!
Wrong wiring leads to immediate destruction of the device.

Application Note

To make the photodiode running reliably, particularly in harsh environment, EMC compatibility and protection against dust, water, and mechanical influences is required. Below listed modules base on a SiC photodiode and guarantee this protection and safety.

UV-probe: SiC based sensor modules in customizable industry grade housings (e.g. cosine response, water pressure proof, sapphire windows) and different electronic output configurations (voltage, current, USB, Can, LAN) to choose from.
